

IMPROVED INTERNATIONAL COMPARISONS OF REAL PRODUCT AND ITS COMPOSITION: 1950-1980

BY ROBERT SUMMERS AND ALAN HESTON*

University of Pennsylvania

A set of international comparisons is developed for 124 countries over the three post World War II decades, 1950-80. A Data Table is presented which gives, for most countries and most years, real product estimates for three different national income concepts and for the major subaggregates consumption, investment, and government. Detailed comparative price level estimates are provided as well.

I. INTRODUCTION

The inadequacy of foreign exchange rates as a basis for international comparisons is well-known.¹ This article gives comparisons more satisfactorily derived for a wide range of countries covering three post World War II decades. A large Data Table presents, for most countries and time points, a set of estimates of quantities and prices. The quantities in each year, made comparable across countries through the use of a common set of world average relative prices ("international prices"), are given for three different price concepts: constant 1975 international prices; current year international prices; and to allow for changes in the terms of trade, constant 1975 international prices for domestic absorption but current international prices for the net foreign balance. Accompanying each constant 1975 international price real output estimate is a breakdown of the total into the real shares devoted to consumption, gross domestic investment, government, and the net foreign balance. Price data relating to each country in each year is given in the form of estimates of the price levels of total output and of each of the three major subaggregates.

What sets off this new research effort from our previously published cohesive set of international comparisons² is: (1) it covers 9 centrally planned economies

*A. Heston, on leave from the University of Pennsylvania, is currently serving as Chief of the International Price Statistics Section of the United Nations Statistical Office. The research underlying this paper was made possible by the World Bank's support of the International Comparison Unit at the University of Pennsylvania, and by a grant from the National Science Foundation. The help of Gottfried Baldwin of the Foreign Demographic Analysis Division of the U.S. Census Bureau and Daniel Bond of Wharton Econometric Forecasting Associates is gratefully acknowledged, and discussions with Hugo Krijnse Locker and Irving B. Kravis were most helpful. Furthermore, the authors are indebted to Douglas O. Walker for making available the "UN tape" and for a number of useful discussions. The estimates of gross national product per capita for the socialist countries appearing in Panel B of the Data Table were prepared jointly with Irving B. Kravis. The substantial computations were carried out by Martin Shanin, T. Fukui and Ju-Yong Park.

¹See Clark (1940), Gilbert, Kravis (1954), Gilbert and Associates (1958), and Kravis, Heston, Summers (1982). Also see footnote 7 below.

²Summers, Kravis, Heston (1980). A set of per capita gross domestic product and gross domestic income estimates was constructed for Kravis, Heston, Summers (1982) to make comparisons over time of the affluence of collections of countries grouped by stage of development.

not previously included and all years from 1950 to 1980; (2) it develops a structural relationship between purchasing power parities and exchange rates based upon a more extensive data set than was previously available and takes account of the variability of exchange rates over time; (3) it averages reasonably independent 1970 and 1975 "shortcut" estimates of per capita income for each of 85 countries in such a way as to allow for the differences in statistical precision of the estimates of the two years; (4) it follows a disaggregate intertemporal extrapolation methodology which better tracks the changes in shares over time, and explicitly measures the effects of changes in the terms of trade; and (5) it provides a method for replicating benchmark comparisons in current year prices for 115 market economies. In addition, the benchmark estimates of the United Nations Comparison Project (ICP) upon which all of the estimate of this paper rest have been updated to take account of recent national accounts revisions.

The description of the general development of the Data Table is organized as follows: section II deals with estimates for 115 market economies and section III with estimates for nine centrally planned economies. Section II is divided between Parts A and B dealing with estimates of real gross domestic product per capita (RGDP) in 1975 and its subaggregates, consumption, gross domestic investment, government, and the net foreign balance; Part C, which is concerned with intertemporal extrapolations; and Part D, where price level estimation is described. Section IV interprets various aspects of the Data Table including its precision, and section V concludes the paper with a brief attempt to place this research in perspective.

A detailed outline of the precise procedures followed in constructing the Data Table is available on request from the authors. A computer tape containing the Data Table (updated to 1981) and supplementary information can be obtained as well to facilitate a reader's use of the information in the Data Table in his/her own research.

II. MARKET ECONOMIES

All market economy estimates have been derived from the data base of the ICP and national accounts data provided by the United Nations Centre for Development Planning. (We speak below of these latter numbers as residing on the "UN tape" as of December 1983). All ICP data were adjusted to conform to the United Nations data set.

A. Estimates of Real Per Capita Gross Domestic Product (RGDP) for 1975 Benchmark Countries

Of the 115 market economies appearing in the Data Table, 30 have received a full benchmark treatment by the ICP for 1975, along with 4 of the 9 centrally planned economies (CPEs). This 34-country³ comparison of real product for 1975, based upon world average relative prices in 1975, is described in detail in

³The 34 ICP countries are Austria, Belgium, Brazil, Colombia, Denmark, France, Germany (F.R.), Hungary, India, Iran, Ireland, Italy, Jamaica, Japan, Kenya, Korea, Luxembourg, Malawi, Malaysia, Mexico, Netherlands, Pakistan, Philippines, Poland, Romania, Spain, Sri Lanka, Syria, Thailand, United Kingdom, United States, Uruguay, Yugoslavia, and Zambia.

Kravis, Heston, Summers (1982) (henceforth referred to as simply KHS). The 1975 entries in the RGDP column of the Data Table for these countries differ slightly from the corresponding Table 6.5 entries of KHS because of data revisions of national currency consumption, investment, government, and the net foreign balance subsequent in 1980,⁴ and because of a modification of the ICP's method of valuing each country's net foreign balance.

Non-benchmark Countries

A structural relationship between the purchasing power parity (PPP) for all of GDP of a country and its exchange rate was developed in Kravis, Heston, Summers (1978) and used again in Summers, Kravis, Heston (1980) to estimate the real gross domestic product per capita of a country for which only regular national accounts data are available.⁵ This relationship was based upon the ICP's 1970 real income comparison for 16 countries. The 1975 data on the 34 countries in the ICP data base make possible the estimation of the structural relationship for 1975. KHS, pp. 332–341, provides a detailed discussion of the relative merits of the 1970 and 1975 relationships, both of which were used in that volume in estimating 1975 RGDP for non-benchmark countries. A revised approach is used here for estimating 1975 RGDP for these countries. First, the cross-section regressions for the two years have been run in terms of per capita domestic absorption (DA) instead of per capita GDP as previously. DA is a more suitable concept for the cross-sections because the estimation of real expenditure shares devoted to consumption, investment, and government draws upon estimates of DA rather than GDP. Getting good real share estimates is important in itself, of course (half the entries in the Data Table refer to shares), but more critical, *all* of the intertemporal extrapolations—national product, national income, and the components—depend upon the 1975 real share estimates. The theoretical underpinning of the cross-section structural relationship (the “productivity differential” model of KHS, pp. 332–33) provides limited guidance on the choice of DA versus GDP, so we have worked with DA even if it *may* not give as good a basis for estimating a non-benchmark country's RGDP for the year of the cross-section. Besides shifting to a domestic absorption basis, the present procedures differ from the previous ones in two respects: (i) a slightly different functional form for the regression is used⁶ and (ii) the 1970 and 1975 cross-section results are combined to get a single 1975 estimate in a more satisfactory way. The extrapola-

⁴The relevant numbers in KHS are those based upon the *System of National Accounts* (SNA). The ICP's classification system for consumption and government differs from the SNA, but the entries of the Data Table, total output as well as consumption, investment, and government shares described below, all refer to the SNA concept.

⁵Earlier examinations of this relationship were carried out by, among others, Clague, Tanzi (1972) and David (1973). Summers and Ahmad presented a paper on this subject entitled “Real GNP of 150 Countries in 1970 and 1972; The World Bank Atlas Revised” at the San Francisco 1974 meeting of the Econometric Society. The latter two were done in the same spirit as the present work, though David was not specifically attempting to estimate real per capita GDP for new countries from their exchange rate converted per capita GDPs.

⁶The openness variable (see below) in our previous cross-section regressions appeared as part of an interaction term and here it is introduced additively. Furthermore, the constant terms in both 1970 and 1975 are not significantly different from zero so they have been suppressed. This simplifies the equation, and also makes the actual and estimated values for the numeraire country, the United States, the same.

tion of the 1970 based estimate to 1975 is carried out in a quite different way (see below), but in addition, in averaging the extrapolated estimate from 1970 with the 1975 direct cross-section one, weights have been devised which take account of the relative precisions of the two cross-sections. The regression equation used to summarize the 1970 and 1975 cross-section relationships is given in (1).

$$(1) \quad \ln \bar{r}_j = \beta_1(\ln \bar{n}_j) + \beta_2(\ln \bar{n}_j)^2 + \beta_3(\ln OP_j) + u_j$$

where

$$\bar{r}_j = \frac{DA_j / PPP_j^{DA}}{DA_{US}} \quad \text{and} \quad \bar{n}_j = \frac{DA_j / XR_j}{DA_{US}}$$

PPP_j^{DA} is the purchasing power parity over domestic absorption and XR_j is the exchange rate, each expressed in national currency units of the j th country per U.S. dollar; and OP_j , a measure of relative openness of the j th economy, is defined as an average of the ratio

$$\frac{\text{Exports}_j + \text{Imports}_j}{\text{GDP}_j} \bigg/ \frac{\text{Exports}_{US} + \text{Imports}_{US}}{\text{GDP}_{US}}$$

for five years before the cross-section year. (See KHS pp. 332–336 for a justification of this functional form and particularly the perhaps puzzling presence of an “independent” variable on the left side of the equation and a “dependent” variable on the right.)

The exchange rate for many countries is volatile so perhaps average exchange rates covering several years should be used in calculating \bar{n}_j as is the practice of the World Bank.⁷ The effect of averaging exchange rates was investigated in estimating the parameters of (1) using the 16 country cross-section of 1970 and then again for the 34-country cross-section of 1975. The test of the usefulness of averaging exchange rates will be illustrated in terms of the 1975 cross-section. The exchange rate value used to convert $DA_{j,75}$ to dollars, $XR_{j,75}$, was defined by (2) as the weighted geometric mean of the 1975 exchange rate and the *real* exchange rates of 1974 and 1976.

$$(2) \quad \overline{XR}_{j,75} = (P_{j,75/74} XR_{j,74})^{\lambda/2} (XR_{j,75})^{1-\lambda} (P_{j,75/76} XR_{j,76})^{\lambda/2}$$

where $P_{j,t/t'}$ measures the change in the relative price levels of domestic absorption of the j th country and the U.S. between t and t' .⁸

⁷The averaging process we have investigated resembles the World Bank's for obtaining the \bar{n}_j 's. However, the World Bank in its annual *World Atlas* series simply uses the resulting \bar{n}_j 's themselves as estimates of relative real per capita GDP. The fact that the hypothesis $\{\beta_1 = 1, \beta_2 = \beta_3 = 0\}$ is so clearly rejected for both 1970 and 1975 argues for the inappropriateness of \bar{n}_j as an estimate of relative income.

⁸Another way of taking into account exchange rate adjustments was also considered. A substitute for real exchange rates was investigated that allowed for incomplete adjustment of exchange rates to changes in relative price movements. In (2), $P_{j,t/t'}$ was replaced by $(P_{j,t/t'})^\alpha$ where α was estimated from an independent cross-section of 118 countries. This variant gave approximately the same \bar{r} estimates as did real exchange rates so it was not adopted, but it appears a promising line of approach. (The purchasing power parity doctrine calls for $\alpha = 1$. In fact, $\hat{\alpha}$ for 75/74 and 76/75 were close to 1. Not surprisingly, the $\hat{\alpha}$'s for 70/69 and 71/70 were much smaller than 1.)

The relative weights given the observed 1975 exchange rate and the 1974 and 1976 ones depend upon the parameter λ in (2). Rather than setting the value of λ *a priori* (no averaging implies $\lambda = 0$; equal weighting implies $\lambda = 2/3$), we allowed a non-linear least squares regression and the data to determine what λ should be. For the 1975 cross-section, the weighting question was resolved unambiguously because $\hat{\lambda}$ was not significantly different statistically from zero. Therefore, $\bar{n}_{j,75}$ was computed using only $XR_{j,75}$. In the 1970 cross-section, however, despite the meager force of the purchasing power parity doctrine before exchange rates were freed up, the value of $\hat{\lambda}$ was very large. Not surprisingly, the noisiness of the parity relationship made $\hat{\lambda}$'s standard error very large too. Since the estimated value of λ implies a highly implausible weighting pattern in which $XR_{j,70}$ would get negative weight, it was decided simply to use $\lambda = 2/3$. (For what it is worth, $\hat{\lambda}$ was not significantly different statistically from $2/3$.) Thus $XR_{j,70}$ was taken as the simple geometric mean of $XR_{j,70}$ and the price-level adjusted values of $XR_{j,69}$ and $XR_{j,71}$.

The empirical equations corresponding to (1) which contribute to our final real DA per capita estimates for 1975 are given in (3) and (4).

$$(3) \quad 1970: \ln \bar{r}_j = 0.459 \ln \bar{n}_j - 0.076 (\ln \bar{n}_j)^2 + 0.065 \ln OP_j$$

(0.089) (0.023) (0.040)

$$\hat{\sigma}_u = 0.093$$

$$(4) \quad 1975: \ln \bar{r}_j = 0.559 \ln \bar{n}_j - 0.038 (\ln \bar{n}_j)^2 + 0.091 \ln OP_j$$

(0.059) (0.017) (0.030)

$$\hat{\sigma}_u = 0.154$$

Two \bar{r} estimates were obtained for each of the 85 non-benchmark countries, $\hat{r}_{j,70}^{(70)}$ for 1970 from (3) and $\hat{r}_{j,75}^{(75)}$ for 1975 from (4). By an extrapolation procedure described below, $\hat{r}_{j,75}^{(70)}$ was obtained from $\hat{r}_{j,70}^{(70)}$. This value, $\hat{r}_{j,75}^{(70)}$, was averaged geometrically with $\hat{r}_{j,75}^{(75)}$ to obtain $\bar{r}_{j,75}$ for all 85 countries, using weights inversely proportional to the variance of error associated with the estimates for similar benchmark countries in 1975.⁹ The vector $\bar{r}_{j,75}$ is the basis for the 1975 RGDP (regarded as identical with RGDP in 1975) for the 85 non-benchmark countries, and is also used to obtain the real expenditure shares for these countries in 1975.

$RGDP_{j,75}$ is equal to real domestic absorption ($RDA_{j,75}$) plus the real value of the net foreign balance ($RNFB_{j,75}$). $RDA_{j,75}$ was estimated simply as $\bar{r}_{j,75}$ multiplied by the value of per capita $DA_{US,75}$ taken from the UN tape. Estimating $RNFB_{j,75}$ involves conceptual problems, however.

One would like to convert trade flows at purchasing power parities as is done with other categories of expenditures. Unfortunately, since many items entering trade are raw materials or intermediate products, it would be a major

⁹Error estimates defined by $(\bar{r}_{j,75}^{(t)} - \bar{r}_{j,75}^{ICP})$ were obtained for the 29 ICP market economies ($\bar{r}_{US,75}^{(t)} \equiv 1$) for $t = 1970$ and $t = 1975$. The systematic relationship between the square of the error and $\bar{r}_{j,75}^{ICP}$ for 1970 and for 1975 was exploited to give a basis for estimating the variances of both the 1970 and 1975 errors for each of the 85 non-benchmark countries. The relative variances of the estimated 1970 and 1975 errors provided the weights for averaging $\bar{r}_{j,75}^{(70)}$ and $\bar{r}_{j,75}^{(75)}$. Generally speaking, the \bar{r} estimates from the 1970 cross-section had lower error variances than the 1975 cross-section for low-income countries and higher error variances for high-income countries.

research task to convert exports and imports at purchasing power parities. The next best approach would be to convert the net foreign balance at the purchasing power parity of the collection of goods and services for which the balance if positive would be expended in the future, or if negative would be exported. Implementing this approach, however, would require more knowledge about future trade patterns than is at all likely to be available. The alternative adopted here is to convert the net foreign balance at the exchange rate on the grounds that at the margin this is the conversion factor for an increment to the net foreign balance. (This is equivalent to setting the international price of a dollar's worth of net balance at 1.)¹⁰ Thus $RGDP_{i,75} = \bar{r}_{i,75} \cdot DA_{US,75} + NFB_{i,75} / XR_{i,75}$.

B. Estimates of Expenditure Shares of Non-Benchmark Countries for 1975

The real expenditure shares devoted to consumption, gross domestic investment, and government for the 30 benchmark countries of the ICP appearing in the Data Table are based upon the updated GDP and subaggregate entries in the SNA section of Table 6.5 of KHS (except for the modification in the treatment of the net foreign balance described above). The shares for the other 85 countries were obtained using a set of structural equations relating real shares and the level of income. (In fact, these variables relate to DA rather than GDP.) The parameters of the structural equations, estimated from the real and nominal share data for the 34 ICP countries, appear in (5), (6) and (7).

$$(5) \quad c_{i,75} = 0.048 \bar{r}_{i,75} + 0.920 cc_{i,75} + 0.013 \ddot{u}_{i,75}^d + 0.158 gg_{i,75}$$

(0.022) (0.027) (0.063) (0.111)

$$\hat{\sigma}_u = 0.033$$

$$(6) \quad i_{i,75}^d = 0.100 \bar{r}_{i,75} - 0.022 cc_{i,75} + 0.837 \ddot{u}_{i,75}^d - 0.035 gg_{i,75}$$

(0.022) (0.027) (0.062) (0.110)

$$\hat{\sigma}_u = 0.032$$

$$(7) \quad g_{i,75} = -0.148 \bar{r}_{i,75} + 0.102 cc_{i,75} + 0.150 \ddot{u}_{i,75}^d + 0.878 gg_{i,75}$$

(0.022) (0.028) (0.063) (0.112)

$$\hat{\sigma} = 0.033$$

The variables on the right denoted by double letters are nominal shares (i.e., shares calculated from the 1975 national currency values); $\bar{r}_{i,75}$ is the real value relative to the U.S. of domestic absorption; and the variables on the left are real share (i.e., shares calculated from expenditures in 1975 international prices). The

¹⁰This is not the procedure that was followed in KHS and earlier phases of the ICP. Rather, the international price of a dollar's worth of net foreign balance there was a weighted average of the ratios of the exchange rate to the overall purchasing power parity calculated for the non-negative categories of GDP. This procedure was used because the aggregation technique used in KHS does not admit categories with negative expenditures. This definition of the international price for the net foreign balance was used because it parallels the treatment of other categories. However, when one solves for the international price of the net balance as part of the ICP's aggregation system, ignoring the fact that some net foreign balances are negative, the international price of the net foreign balance comes out quite differently from the ICP's method.

rationalization of these structural relationships and a description of the estimating procedures utilized is given in Summers, Kravis, Heston (1980) and will not be repeated here. The relationships were originally developed for the 1970 data of Phase II of the ICP, and the (5), (6), and (7) relationships fairly closely parallel the previous ones. Only the effect of income on consumption changed between 1970 and 1975; in the earlier year, variations in \bar{r} had no effect on c in (5), given cc , ii^d , and gg .

Using (5), (6) and (7), real share values were estimated for the 85 non-benchmark countries on the basis of the national accounts data on the UN tape.

C. Extrapolations to Other Years

(1) RGDP: Real Gross Domestic Product Per Capita

In Summers, Kravis, Heston (1980), $RGDP_{j,t}$ was extrapolated from $RGDP_{j,75}$ on the basis of the constant-price GDP per capita series on the (earlier) UN tape. The extrapolations in the Data Table here have been carried out at a more disaggregated level. The UN tape's constant-price series for consumption, gross domestic investment, government, and the net foreign balance were used to get the individual real components, expressed in 1975 international dollars, for each of the years between 1950 and 1980. $RGDP_j$ was obtained simply as the sum of the components, where the net foreign balance exports and imports in 1975 were converted to dollars at current exchange rates.¹¹ This new disaggregate procedure is superior to the previous one because it insures that the price weights used for consumption, investment, and government in each year in each country reflect 1975 *international* prices rather than the individual countries' relative prices.

The real shares for years other than 1975 are computed as the ratio of the individual real aggregate to RGDP. These estimates differ from the ones appearing in Summers, Kravis, Heston (1980) in a critical way: the previous estimates were based on the assumption that in every year the real shares were related to income and the nominal shares in accordance with the relationship observed in the year of the ICP benchmark study (1970 in Summers, Kravis, Heston (1980)). The present method depends upon no such assumption. Essentially, a real share is estimated for 1975 on the basis of the 1975 observed relationship, and the values for other years are obtained as straightforward constant-price extrapolations from the 1975 figure.

(2) RGDP*: Real Gross Domestic Product Per Capita Adjusted for Changes in the Terms of Trade.

In the Data Table a counterpart to RGDP is given which takes account of a country's changing ability to use its exports to buy imports as its terms of trade change over time. This alternative real gross product per capita concept, RGDP*, still measures domestic absorption in 1975 international prices but allows for

¹¹See footnote 10. The international price of a dollar of net foreign balance here is 1.00; the ICP's 1975 international price was 1.28. Computations have also been done on this latter basis, and are available (along with exchange rates and some other detail omitted from the Data Table) on the computer tape available from the authors.

current export and import prices in valuing the net foreign balance and thus for some purposes may be regarded as a better income variable than RGDP.¹² That the effects of changes in the terms of trade are substantial can be seen in the differences between the RGDP and RGDP* entries in the Data Table as one moves away in time from 1975, the base year. (In the base year $RGDP_j = RGDP^*_j$.) The method of adjustment of the net foreign balance used was that of Courbis/Kurabayashi, the preferred method of Gutmann (1981) and the authors. (Note though that when alternative methods were applied to examine their robustness, substantial differences were observed for a number of developing countries and oil economies.)¹³

(3) *RGDY*: Real Gross Domestic Income Per Capita

As described above, RGDP extrapolated to years earlier and later than 1975 values each year's output in 1975 international prices. On the other hand, if a benchmark study were conducted annually, the comparisons among countries each year would be based upon the *current* year's international prices. Such comparisons in current year prices would be extremely useful for a variety of purposes, but each benchmark study as it is usually carried out requires a detailed collection of individual prices in each country. The prices are used to estimate purchasing power parities for detailed categories of goods, and these PPPs are combined with detailed national currency expenditure data to get overall gross product comparisons. It is not feasible to conduct such benchmark studies annually—and in any case it could not now be done directly for past years. However, operating at the quite aggregative level of consumption, gross domestic investment, and government, it is possible using the current and constant price expenditure series on the UN tape to estimate current year purchasing power parities for the broad aggregates. The parities plus the current price expenditure

¹²A recent summary of the literature on this subject is provided by Gutmann (1981).

¹³This is in contrast with Gutmann's finding that there was little empirical difference between five methods of adjustment for terms of trade using data for 6 OECD countries from 1970 to 1977. It was found here, for example, that in the case of Iran, the 1955 ratio of RGDP* to RGDP is 0.89 as calculated using Courbis/Kurabayashi but applying the Geary 1 and Geary-Burge alternative methods give 0.90 and 0.68 respectively. In the same year the figures for Zambia were 1.35, 1.47, and 1.76 for the three methods; such differences are not surprising for a country with a large deficit or surplus and fluctuating export and/or import prices. The definitions of the methods are as follows:

$$\text{Courbis/Kurabayashi} \quad \delta = \frac{Mx}{X+M} \left(\frac{P_x}{P_m} - 1 \right) + \frac{Xm}{X+M} \left(\frac{P_m}{P_x} - 1 \right)$$

$$\text{Geary} \quad \delta = x \left(\frac{P_x}{P_m} - 1 \right)$$

$$\text{Geary and Burge} \quad \delta = m \left(\frac{P_x}{P_m} - 1 \right) \text{ for a surplus; } x \left(1 - \frac{P_m}{P_x} \right) \text{ for a deficit}$$

- X : current exports
- M : current imports
- x : current exports deflated by p_x
- m : current imports deflated by p_m
- p_x : price index for exports
- p_m : price index for imports
- XR : exchange rate

$$RGDP^*_j = RGDP_j + \delta_j / XR_{j,75}$$

data on the tape can be the raw material for a set of comparisons based upon current year prices.¹⁴

Where in KHS the ICP's aggregation procedure (the so-called "Geary-Khamis method" described on pp. 76-8) was applied to the detailed data of 150-odd categories of expenditure in 34 countries, here the same procedure can be applied to the rather aggregate data of 4 categories of expenditure in 115 countries. Thus the equivalent of a set of annual benchmark studies can be obtained.

The column headed "y" in the Data Table contains the results of these replications of benchmark studies. Specifically, for each country in a particular year, y (a percentage) equals 100 times the ratio of the country's gross product per capita to the gross product per capita of the United States, both valued in that year's international prices for the broad aggregates. The y 's are to be interpreted as the equivalent of the SNA entries of Table 6.4 in KHS.

D. Price Levels

The price level for each aggregate of a country—gross domestic income, consumption, gross domestic investment, or government—is a concept designed to illuminate whether prices for the aggregate are high or low relative to those of a numeraire country, given the rate at which the currency of the two countries can be exchanged. Thus, the price level for any aggregate is equal to the ratio of the country's PPP for the aggregate to the country's exchange rate. The price levels reported in the Data Table are derived from the RGDP calculations just described. For each aggregate the price level is defined as the value of the national currency total converted at the exchange rate divided by the international dollar total valued at the international prices derived from the Geary-Khamis run for that year, all divided by the same ratio for the U.S.

III. CENTRALLY PLANNED ECONOMIES

Only estimates of RGDP are presented for the nine centrally planned economies of Panel B of the Data Table. Most of these are based upon information sources outside of the ICP and United Nations.

The panel was built up in two steps: (1) 1975 RGDP expressed in 1975 international dollars was estimated for each country; (2) each 1975 RGDP was extrapolated backward to 1950 and forward to 1980.

The 1975 estimates for four countries, Hungary, Poland, Romania, and Yugoslavia, were obtained directly from the ICP (KHS, Table 1.2). The People's Republic of China figure was taken from Kravis (1981). The Soviet Union RGDP was derived from a Fisher "ideal" estimate of the Soviet Union relative to the U.S. in 1976 taken from Edwards, Hughes, Noren (1979).¹⁵ The 1975 RGDPs for the remaining three countries, Bulgaria, Czechoslovakia, and the Democratic

¹⁴A somewhat more refined procedure along these same lines is used by the Statistical Office of the European Community (Eurostat (1983), chapter V), and a variant on it was employed in the Phase II benchmark studies of the ICP.

¹⁵This Fisher index was adjusted upward to allow for the typical difference between binary and multilateral indexes in countries at the income level of the Soviet Union.

Republic of Germany were based upon 1973 estimates, derived by the physical indicator method, reported in *United Nations* (1980).¹⁶

The extrapolations of real per capita output were based upon three sources. Inevitably, these extrapolations could not be derived from real income time series based upon 1975 international prices. The People's Republic of China extrapolations for 1950–78 were based upon a GNP series of the National Foreign Assessment Center (1979); the 1979 and 1980 figures were based upon annual changes in national income reported in the Chinese government's Communiques on Fulfillment of Economic Plans for 1979 and 1980. The Soviet Union extrapolations were estimated from a fragmentary real GNP series in Edwards, Hughes, Noren (1979) with interpolations and extrapolations for missing years in the 1950–80 time period based upon an earlier real GNP series of Greenslade (1976). The extrapolations for Yugoslavia were derived from a GNP series in World Bank (1980). The extrapolations for the remaining seven centrally planned economies of eastern Europe were all based upon annual estimates of GDP in Alton (1982).

The source of the population figures for all countries but the People's Republic of China was Shoup (1981) as revised and updated by the Foreign Demographic Analysis Division of the U.S. Census Bureau. The figures for China, kindly supplied by John S. Aird, are the Model 2 (June 1982) projections of the same agency.

IV. THE USE OF THE DATA TABLE

Panels A and B of the Data Table cover 124 countries which together contain more than 95 per cent of the world's population. The major omissions are Cuba of the centrally planned economies and Kuwait, Libya, Saudi Arabia, and Lebanon of the market economies. (Cuba and Lebanon are not represented because of insufficient information, and the three oil-exporters have such large net foreign balances that the estimates derived from the cross-section regressions described above are highly unreliable.) Estimates are provided for all countries for the years 1960–80. The U.N. tape lacks data on half the countries in the 1950's, so the coverage is incomplete during that decade.

Market economies: Panel A

Estimates are provided for each country and each year for three national income concepts: gross product per capita measured in 1975 international prices (RGDP); gross product per capita measured in current year international prices expressed relative to that of the United States (y); and a gross product per capita figure based upon 1975 international prices which has been adjusted to take account of changes in the terms of trade over time (RGDP*). $RGDP_{jt}$ and $RGDP_{jt}^*$ are both directly comparable across countries and time, but the y_{jt} 's are comparable only across countries within a year.

Estimates of the real shares of real GDP expressed in 1975 international prices allocated to consumption, gross domestic investment, and government as defined by the SNA are presented as percentages under the headings c , i^d , and

¹⁶The physical indicator estimates, extrapolated forward to 1975, were increased by 4 percent to allow for the finding that the equivalent UN estimates for Hungary, Poland, Romania, and Yugoslavia were on average lower by that amount than the corresponding ICP estimates.

g. They, along with the share allocated to the net foreign balance, add up to 100 percent, so the latter share though not printed can be obtained as a residual from the other three.

Estimates of price levels defined as PPP/XR have been estimated for each country and year for all of gross product and each of the major components. These estimates all refer to the individual countries' own current prices, of course.

To enable the reader to recover the total figures from the per capita ones, the population of each country is provided for each year.

Centrally Planned Economies: Panel B

The centrally planned economies of eastern Europe and Asia measure their national incomes using a different methodology from that of the market economies. As a consequence, estimates are not available of the ten economic numbers provided for the market economies. However, by combing the CPE literature, we have brought together estimates of RGDP, measured in 1975 international prices, for 9 centrally planned economies. Some ICP information on Hungary, Poland, Romania, and Yugoslavia has been drawn upon in getting the RGDPs. But for the most part, the RGDP estimates are the work of others. The numbers are placed here for the convenience of readers needing directly comparable national income data for both market and centrally planned economies.

The Precision of the Estimates

The imprecision of the national income estimates in Panel A varies considerably from country to country and from year to year. In a quite subjective way we have classified countries' estimates into four quality classes, A, B, C, and D with the relative standings D: Fair, C: Good, B: Better, and A: Best. These letter grades appear in the 1980 section of Panel A in the right-hand column headed "Q".

The classification flows from what appears to be the main sources of imprecision in the estimation process: (i) the imprecision inherent in the ICP benchmark estimates as quantified in KHS, Table 3.6, column (7); (ii) the imprecision arising from the use of a cross-section regression approach in making estimates for the non-benchmark countries; and (iii) closely related to (ii), the imprecision that comes from not really knowing what year's cross-section to rely on. (That is, not *really* knowing what weights to use in averaging the 1970-derived and 1975 cross-section estimates of \bar{r} .)

The ICP imprecision is inversely correlated with real income, and the same is apparently (but less certainly) true for the noise in the cross section regression. Twice the standard errors of the regressions $\hat{\sigma}_u$ printed beneath both (3) and (4) probably indicates the maximum percentage error that might be encountered from using the cross-sections. The consideration underlying (iii) is quantified as well as it can be done by comparing the estimates of $\hat{r}_{j,75}^{(70)}$ with $\hat{r}_{j,75}^{(75)}$. These are presented in the 1980 section of Panel A in the column headed Δ . Specifically,

$$\Delta = (\hat{r}_{j,75}^{(75)} - \hat{r}_{j,75}^{(70)}) \div [(\bar{r}_{j,75}^{(75)} + \bar{r}_{j,75}^{(70)}) \div 2].$$

The Δ 's are highly correlated *negatively* with real income and apparently the Δ 's are higher for African countries than others even after controlling for income.

The quality ratings of the countries in Panel A reflect these considerations. *Ceteris paribus*, benchmark countries are rated higher than non-benchmark countries; higher income countries are rated higher than lower income countries; countries with larger Δ 's are rated lower than those with lower Δ 's; and African countries are rated lower than non-African countries. We think these relative ratings apply specifically to RGDP in 1975, but probably apply to all of the other estimates too.

One comment on imprecision over time is in order. It is a slight exaggeration to say that $RGDP_{j,75}$ is a measure in 1975 international prices of the j th country's real per capita GDP in the year t . Strictly speaking, the prices *within* each major component are the country's own prices (for a year that may not be the same for each country!). The 1975 international prices reflect the world average relative prices of overall consumption vs. investment vs. government. This distinction may become important as one moves from 1975 forward and backward through time. Furthermore, some countries' intertemporal price indexes are poor. These considerations suggest that the quality of estimates for years far from 1975 is likely to be lower than for years close to 1975, *ceteris paribus*.

Comparing Benchmark Countries with Non-Benchmark Countries

For the benchmark countries the Data Table entries for 1975 are based on the benchmark study. If the estimating procedure for non-benchmark countries for RGDP were applied to the benchmark countries, an alternative RGDP estimate would be obtained. The difference between these two estimates may be thought of as an estimation error. For the non-benchmark countries, in the absence of any specific information, the numbers in the Data Table are based on the assumption that this estimation error is zero. This means that for comparisons between benchmark and non-benchmark countries, one would usually simply compare the Data Table entries. (This would always be appropriate for comparisons between two benchmark or between two non-benchmark countries.)

However, if the user of the Data Table is making a comparison between a benchmark country and a non-benchmark country where it is felt the estimation errors would be similar, then a factor could be applied to the Data Table entries (say, RGDP, RGDP*, or y for any year) for the benchmark country to take account of the error associated with the relevant benchmark country. (This factor, given in the Notes to the Data Table for the 30 non-centrally planned ICP countries, is the ratio of the benchmark RGDP to the RGDP estimate if estimated by the procedure for non-benchmark countries.) For example, if one were comparing Malawi and Tanzania, and believed because of location, type of economy, or other reasons that the error associated with Malawi is likely to be similar to that for Tanzania, then one would multiply the Tanzania Data Table entry by 0.883, the factor given below for Malawi. Comparisons involving more than one benchmark country with one or more non-benchmark countries where errors cannot be assumed to be zero raise further complications that the reader may wish to cope with.

V. CONCLUSION

It is self-evident that it would be highly desirable to have a complete set of real national accounts figures denominated in a common currency covering a

large number of countries and a long period of time. The Data Table purports to provide such a set of accounts. Individual numbers in the Table are perishable because new benchmark studies in the future will reduce the number of countries that must be given a non-benchmark treatment. More than that, the new studies should improve the quality of non-benchmark estimates, either through improved estimating methods of the type used in this paper or through techniques of linking non-benchmark countries to economically adjacent ones.¹⁷ However, the extrapolation and disaggregation procedures followed here, while certainly improvable, are likely to have substantial staying power because the prohibitive cost of benchmark studies will inevitably leave time gaps that must be filled in.

¹⁷The ratings of present non-benchmark countries included in new studies (like the 15 African countries in the ICP's Phase IV) will be raised at least one level, but the ratings of present benchmark countries are not likely to change. New 1980 estimates compiled by EUROSTAT (1983) following a slightly different methodology from the ICP's deviate from those in the Data Table by an average absolute value of 4.7%. (If one allows for the difference between the 1975 estimates of EUROSTAT and the ICP for the same countries, the mean absolute difference is only 3.2%.) A similar comparison with ECIEL 1979 estimates for 18 Latin American countries shows a somewhat larger mean absolute deviation, 11.5%. The new EUROSTAT study provides better comparisons among Economic Community countries but does not allow comparisons with countries outside the Community on the basis of a consistent set of international prices. The same is true for the ECIEL study. For this reason neither set has been integrated into the Data Table.

Notes to Data Table

A. Definitions of Variables

Y_{jt} : $\text{RGDY}_{jt}/\text{RGDY}_{US,t}$

RGDP_{jt} : Real gross domestic income per capita (current international prices)

RGDP_{jt}^* : Real gross domestic income per capita (1975 international prices)

$\text{RGDP}_{jt}^{\#}$: Real gross domestic product per capita adjusted for changes in the terms of trade (Domestic absorption in 1975 international prices; net foreign balance in current prices)

c_{jt} : Percentage of real gross domestic product devoted to consumption (1975 international prices)

i_{jt}^d : Percentage of real gross domestic product devoted to gross domestic investment (1975 international prices)

g_{jt} : Percentage of real gross domestic product devoted to government (1975 international prices)

\bar{P}_{jt} : Price level for gross domestic income ($\text{PPP}_{jt}^C/\text{Exchange Rate}_{jt}$)

P_{jt}^C : Price level for consumption ($\text{PPP}_{jt}^C/\text{Exchange Rate}_{jt}$)

P_{jt}^I : Price level for gross domestic investment ($\text{PPP}_{jt}^I/\text{Exchange Rate}_{jt}$)

P_{jt}^G : Price level for government ($\text{PPP}_{jt}^G/\text{Exchange Rate}_{jt}$)

POP_{jt} : Population (in thousands)

Δ : The difference between 1970-based and 1975 cross section estimates of country's real domestic absorption. $(\bar{P}_{j,75}^{(75)} - \bar{P}_{j,75}^{(70)}) \div [(\bar{P}_{j,75}^{(75)} + \bar{P}_{j,75}^{(70)}) \div 2]$.

Q: Quality rating: D: Fair; C: Good; B: Better; A: Best

B. Country Numbers

From 1960 to 1980 all countries are represented in the Data Table, and each has the same serial number beside its name. Prior to 1960, the number beside each country's name corresponds to the 1960 to 1980 number; the right hand column in these years gives the serial number for each year.

C. Benchmark Error Factors

Kenya (0.748), Malawi (0.883), Zambia (0.730), India (1.053), Iran (1.042), Japan (0.990), Korea (1.208), Malaysia (1.093), Pakistan (1.000), Philippines (1.044), Sri Lanka (1.361), Syria (1.136), Thailand (1.134), Austria (1.019), Belgium (1.048), Denmark (1.030), France (1.003), Germany (0.986), Ireland (0.956), Italy (0.942), Luxembourg (1.136), Netherlands (1.067), Spain (1.078), U.K. (1.016), Brazil (0.808), Columbia (1.222), Jamaica (0.837), Mexico (0.942), Uruguay (1.157), and U.S. (1.00 because it is numeraire).
